

Requirements For the Porject

Basic requirements

- Create issue
- Issue must have an unique id or name
- We can create update or delete it
- Issue will have a state of (New, Inprogress, Completed, Blocked,)
- Issue will have a etimated time, completed time, which will calculate the delays and the effort
- Issue will show when it is created updated and whats the due date of it
- It can be assigned to any one
- It contains comments, attachments, mentions // No Need for now
- There would be a search and filter which can serach by issue search by assigned person we can also apply sorted by date and time in this scenario by filter
- Priority of the issue and the role

Tracking of the issue

- Status update which means that state should remain maintained
- Activity logs should be monitored like when the issue is changed who changed it and what is changed

Collaboration

- User Role & Permissions
- Admin will manage the projects and also assign roles to other colleagues
- Eengineers can create update maintain delete the issue
- Quality Assurance will generate report and bugs can also check engineers issue when it is done

Dashboard Analytics (Excluded)

- Overview of the issue
- Performance metrics
- Graphs

New Ideas

- Time consuming data entry issue overview send to team members send the report to stake holders single point of contact should be present in team to talk about defects to stake holders
- Not tracking the issue persist from the same issue log it in that issue and labelled as sub issue relates to depends on or a blocker
- Analyze the work done and write description and may be input fields (AI Mopdel can do this and save time)
- Use templates required for field submission
- If any issue left opened unmaintained unclosed auto close these issues
- While using the app if any issue is raised by anyone notification will be sent to every one
- Permissions and access (excluded)
